# **Included Accessories**

Below are the accessories that are included with your purchase. Please check to ensure that none are missing or damaged. If so,please contact your local distributor.

# **1. Introduction**

#### **1.1 Preliminary Information**

#### Thank you for your purchase of our quality heat pump.

This manual is intended to provide detailed instructions for the successful installation of your newly purchased heat pump product. Please ensure that this manual, along with the User's and Service manuals, are kept in an easy-to-access location for your reference later on.

#### DISCLAIMER

Proper adherence to the directions provided herein is vital for both the smooth operation of this system, as well as for your safety and the safety of those around you. Amitime Electric Co., Ltd. is not responsible or liable for any losses incurred due to misuse or mishandling of this product, which includes, but is not limited to:

- Purchasing, installing, and/or operating this product with the intention of using it outside of its established, technical purpose.
- Carrying out improper work upon the unit, or any of its components, that has not been given explicit, prior consent in the form of writing.
- Installation attempts of this system by anyone other than a properly trained and licensed professional.
- Negligence of properly-worn personal protection (safety glasses, gloves, etc.) while performing installation, maintenance, or servicing of this product.
- The operation of this system during ambient temperatures which are below or beyond the temperature range intended (-25°C to 43°C)

#### SAFETY

If unsure of what installation procedures to use, please contact your local distributor for information and/or advisement. Any accessories used with this product must be official only. Any electrical work must be carried out by certified electricians only. The manufacturer is not responsible for any alterations or modifications that are made without explicit, written approval. The design of this unit complies and conforms to all necessary and relevant safety regulations, and is otherwise safe to operate for its intended use.

Please pay attention to the following pages, which detail important precautions that should be closely followed, to ensure safe installation and operation .

#### **1.2.Safety Precautions**

To ensure both your personal safety, as well as the safety of the product, note the symbols below and be sure to understand their correlation to each of the precautions depicted.

#### **1.2.Safety Precautions**

### 4.1. Sanitary Hot Water Applications

If sanitary hot water is need, a 3-way diverting valve should be included. It is recommended to set up your sanitary hot water system identically to one of the configurations shown below and on the following pages.

#### 4.1.1.Configuration 1

In this configuration, hot water circulating through the heat pump circuit floods the tank. This submerses the coils, which run the shower water circuit, resulting in a heat exchange interaction. A mixing valve ensures that temperatures do not exceed  $60^{\circ}$ C

The primary advantages of this application include:

- Sanitization is not necessary, since the sanitary hot water is heated by going through the coils.
- Direct connection between heat pump and tank, ensuring effective water flow rates for it.
- Energy savings from not requiring sanitization.

A disadvantage of this configuration is a decreased volume of sanitary hot water available when compared with other configurations, due to the smaller diameter of the transfer coils.

### 4.1. Sanitary Hot Water Configurations

#### 4.1.2.Configuration 2

In this configuration, hot water from the heat pump circuit runs through the coils in the tank. Sanitary water fills the tank and is heated by the coils before exiting the tank towards the shower head. This configuration also does not require sanitization.

The primary advantage to this configuration is that it can supply a greater volume of sanitary hot water.

Disadvantages include:

- The coil may create enough resistance to water flow that a secondary heat pump could be needed, in order to ensure that a proper flow rate, efficiency, and proper operation are maintained.
- The capacity of the coils will need to be greater than or equal to the maximum output of the unit. (Max. heat pump output occurs at 7°C Air/45°C Water)

This configuration is optimal for a heat pump that does not exceed 14kW.

### 4.1. Sanitary Hot Water Configurations

#### 4.1.3.Configuration 3

A water-to-water plate heat exchanger can be substituted for the coil inside water tank, as shown below:

Note: The heat pump unit can control the sanitary hot water circulation pump by connecting it to port "P3".

This configuration will ensure a sufficient volume, as well as flow rate, of hot sanitary water, at the additional cost of adding the plate heat exchanger.

Whichever application is chosen, it is recommended to install a manual mixture valve between the city water inlet and hot water outlet. This will maximize utilization of hot water from the tank while also preventing scalding shower water temperatures.

Also, if the tank permits, it is optimal to utilize a 4-way mixture valve, as depicted in the picture below. This will promote more even and steady distribution of hot water from the tank.

### 4.1. Sanitary Hot Water Configurations

#### 4.1.4. Note about the Heating/Cooling Distribution System

Users are heavily recommended to install a buffer tank into the chosen configuration, especially when the method of hot water distribution is below 20L/W of water volume.

The buffer tank should be installed between the heat pump and the distribution system, in order to:

- Ensure the heat pump unit provides a stable and sufficient water flow rate.
- Minimize fluctuation of the system's heating/cooling load by storing unused heat.
- Increase capacity of water volume distribution, which helps ensure proper heat pump operation.

If the method of hot water distribution is capable of dispersing a large enough flow rate, a buffer tank can be excluded from installation into the configuration. If so, please move the cooling/heating temperature sensor (TC, #10 on page 1) to the water return pipe, so that fluctuations of water temperature due to compressor speed changes are minimized.

### 4.2. Heating and Cooling Circuits

This heat pump unit is capable of controlling two completely different heating and cooling circuits, as shown in the following images.

Configuring the temperatures for circuits 1 and 2 can be done via the "Heating and Cooling Circuit" menus.

If only one circuit is desired, then "Heating and Cooling Circuit 2" can be set to OFF.

#### 4.2.1. Heating & Cooling Circuits

		Page:1/5	
Heating/ Cooling circuit		Heating/Cooling Stops Based on Water ∆T	2°C
	Heating/Cooling Restarts Based on Water ΔT	2°C	
		ΔT Compressor Speed-reduction	2°C
		Set temp. for Cooling	24℃
		Heating Curve	
		Heating <u>c</u> ooling Circuit 2	
Heating/ Cooling circuit		Set temp. For Cooling	24℃
	Set Temp. for Heating (without heating curve)	35℃	
		Mixing Valve	
		Heating Curve	

The basic understanding of these settings is found under your the software section of your particular assembly walkthrough in Chapter 3. A more detailed explanation can be located in the user's manual.

### 4.2. Heating and Cooling Circuits

#### 4.2.2. Mixing Valves MV1 and MV2

	Page:5/5	
Heating/ Cooling circuit	High Temperature Limit	40°C
	Mixing Valve	
	Heatingsooling Circuit 2	
	Set temp. For Cooling	24°C
Heating/ Ceoling circuit	Set Temp. for Heating (without heating curve)	35℃
	Mixing Valve	
	Heating Curve	

If the system water temperature may be higher (or lower) than the temperatures needed for circuit 1 (or circuit 2) in a heating or cooling operation, then a mixing valve can be added to the circuit, and connected to the MV1 (or MV2) port on the indoor unit.

The unit will control the mixing valve, continuously mix the supply, and return the water of the circuit to have its temperature read via the TV1 (or TV2) until the value set under the above menus is achieved.

TV1 and/or TV2 should be activated on the installer's level via the "Heating and Cooling Circuit" menu.

Note: A mixing valve is needed, if:

- The system has two circuits that require different water temperatures. The heat pump will have to take the higher/lower (depending on whether heating/cooling) settings of the two circuits as the set temperature for the heat pump. The mixing valve ensures correct water temperature circulation in this instance.
- The system has other heating sources inside that are not controlled by the heat pump. In this case, the actual water temperature may exceed the set temperature.

### 4.2. Heating and Cooling Circuits

#### 4.2.3. Circulation Pump Control

Buffer Tank	
P1 for Heating Operation	
P1 for Cooling Operation	
P1 with High Temp. Demand	
P2 for Heating Operation	
P2 for Ccoling Operation	
P2 with High Temp. Demand	

Note: P1 is circulation pump 1, P2 is pump 2

- "Buffer Tank" should be checked if one is installed between the heat pump and distribution system.
- "P1/P2 for Heating/Cooling Operation" sets that circuit's pump to work for heating or cooling.

If "Buffer Tank" is NOT checkmarked, both P1 and P2 will only work when the compressor is working in the same mode that the pump is set to. So, if P1 is set to "P1 for Heating Operation", P1 will activate ONLY when the compressor is working in heating mode. If P1 is checkmarked for both "Heating" and "Cooling" operations, then P1 will be ON when the compressor is working in both heating and cooling modes. The pump stops when switched to DHW mode, or after the set temperature is reached.

If "Buffer Tank" IS checkmarked, both P1 and P2 will work as long as there is demand from the distribution system, as per the pump setting. The following must also be fulfilled:

- Actual temperature in the buffer tank (detected via TC) is equal or above 20°C (in heating)
- Actual temperature in the buffer tank (detected via TC) is equal or below 23°C (in cooling)

Even if the unit is working in DHW mode, or the set temperaure is reached, the circulation pump will start to work as long as there are heating/cooling demands, and TC is fulfilled as per the above.

• "P1/P2 with High Temp. Demand" sets P1/P2 to automatically stop if the signal for "high demand" is off. For more information regarding this setting, please refer to part D on page 62.

**NOTE:** It is very important to place the temperature sensor (TR) in a central location with good circulation, with no hot or cold equipment nearby, in a column or interior wall, or somewhere similar.

### 4.3. Indoor Unit Installation

#### 4.3.1. Choosing an installation location

- The indoor unit should be installed indoors, mounted on a wall, and have the water outlet aimed downwards.
- 2) The indoor unit must operate in a dry, well-ventilated location.
- 3) There should be no volatile, corrosive, or flammable liquids or gases nearby.
- 4) Ideally, the unit should be as close as possible to the water supply system.
- 5) Try and leave enough space in the area around the unit to simplify future maintenance.

The minimum dimensions of surrounding gaps suitable for the unit to operate correctly is as follows:

### 4.3. Indoor Unit Installation

#### 4.3.2. Installation Process

Choose a very firm wall for installation. If it's a wooden wall, use self-tapping screws instead of expansion bolts. Hang the mounting board onto the wooden wall directly, without drilling holes. Ensure the wooden wall is sufficiently firm. Walls that are too thin, brittle, or humid are not inadequate for installation.

1) Take out the expansion bolts and mounting board accessory. Place the mounting board on the wall horizontally. Mark the bolting location onto the wall.

2) Drill holes with the proper diameter for the bolts to catch through.

3) Unscrew the nuts from the expansion bolts.

4) Loosely fix the mounting board onto the expansion bolts. Do not tighten yet.

5) Using a hammer, tap the expansion bolts into the drilled holes. Fasten the nuts with a wrench to fix the mounting board to the wall.

6) Hang the indoor unit onto the mounting board, making sure it is stable and placed well. The installation is then complete.

### 4.4. Outdoor Unit Installation

#### 4.4.1. Choosing an installation location

- 1) The outdoor unit can be installed in an open safe, corridor, balcony, roof, or hung onto the wall.
- 2) Install in a dry, open airspace. Humidity can cause corrosions or short-circuiting to the electronics.
- 3) There should be no volatile, corrosive, or flammable liquids or gases nearby.
- 4) Do not place the unit nearby to bedrooms and living rooms. There will be noise when it is running.
- 5) In harsh climates of snow or sub-zero temperatures, ensure the unit is raised 50cm above ground.
- 6) It is recommended to install an awning above the unit, to prevent snow from clogging open parts.
- 7) Ensure there is proper drainage around the unit. Tilt the unit by 1cm/m for rain water evacuation.
- 8) Do not install the unit close to kitchen exhaust ports. It is difficult to clean oil from smoke exhaust.
- 9) The location of installation must provide sufficient space around the unit. The minimum dimensions of surrounding gaps suitable for the unit to operate correctly is as follows:

### 4.4. Outdoor Unit Installation

The platform must be at least 500 mm above ground.

#### 4.4.2. Installation Process

For the installation, users can either use the dedicated mounting bracket provided by the supplier, or prepare a suitable bracket that meets the following requirements.

- 1) The unit must be supported by either flat concrete blocks, or a dedicated mounting bracket. The bracket should be able to support at least 5x the unit's weight.
- 2) After the bracket is fixed, ensure each of the nuts are fully tightened.
- 3) Users should double check to make sure the unit's installation is sufficiently sturdy.
- 4) The bracket material can be stainless or galvanized steel, aluminum, or other proper substitutes.
- 5) The user can opt to use two concrete blocks, or a raised concrete platform, instead of a dedicated mounting bracket. Ensure that the unit is securely fastened after installation.
- 6) Use the oudoor unit's dimensions when choosing a suitable wall bracket.

### 4.5. Wiring

#### 4.5.1. Explanation of Terminal Block 1

#### A: Unit power supply

This should be connected directly to the city power supply. For all units, ensure that a cable of sufficient gauge is used. (found on nameplate)

E: Poewr supply to outdoor unit anti-freezing electric heater for plate heat exchanger and water pipe.

### 4.5. Wiring

#### 4.5.2. Explanation of Terminal Block 2

**A:**P0:Pump for heat pump circulation.

#### B, C: Water Pump

A-Pump 1: Pump for Heating & Cooling Circuit 1, B-Pump 2: Pump for Heating & Cooling Circuit 2,

If there is an external water pump in heating, cooling and hot water system, it can be connected to these ports, to be under the control of heat pump,

### 4.5. Wiring

#### 4.5.3. Explanation of Terminal Block 3

- **A:** Signal output to Auxiliary Heater (AH), which will be used as auxiliary heating source for both heating and DHW operation.
- **B:** Signal output to Hot Water Tank Backup Heater (HWTBH), which will be used as backup heating source for DHW operation only.
- **C:** Signal output to Heating Backup Heater (hbh), which will be used as backup heating source for Heating operation only.
- **D:** 3-way motorized valve diverting the water.

### 4.5. Wiring

#### 4.5.4. Explanation of Terminal Block 4

A: Signal cable between indoor and outdoor unit.

#### B, C: Cooling and Heating Mode Switchovers

This unit is capable of switching between heating and cooling automatically, according to the ambient temperature, or external signal input. Please refer to the user's manual for more detailed explanantions on ambient temperature setting. For external signal input, the external signal should be connected to "Cool Mode Switch" for cooling operation, and "Heat Mode Switch" for heating operation.

### 4.5. Wiring

#### 4.5.5. Wiring Process Preliminary Precautions

- Please ensure that a suitable circuit breaker is used for the heat pump.
- The power supply to the heat pump unit must be grounded.
- Wiring should be done by a licensed professional, and comply with industry regulations.
- The unit should be completely powered off before any wiring is done.
- Cables should be properly fastened into place, to prevent loosening from occurring.
- No cable should be fastened to another.
- The power supply should be compliant to all standards located in the rating label.
- The power supply, necessary cables, and sockets should fully meet the input power requirements of the unit.

### 4.5. Wiring

#### 4.5.5. Wiring Process

1) Open the indoor unit's front panel and remove the electrical box cover.

2) Acquire one (or two) power cable(s) of suitable length that is compliant to all local safety regulations.

- A. Insert one end of this cable through the cable gland on the bottom of the indoor unit, and connect it with the heat pump power supply terminals (PE, N, L).
- B. Fasten the cable gland to ensure the cable won't loosen.
- C. Connect the other end of the cable to the city power supply.

### 4.5. Wiring

3) Connect the auxiliary heater power cable:

Acquire a power cable of suitable length that is compliant to all local safety regulations.

- A. Insert one end of this cable through the cable gland on the bottom of the indoor unit, and connect it with the AH power supply terminals (PE, N1, L1)
- B. Fasten the cable gland to ensure the cable won't loosen.
- C. Connect the other end of the cable to the city power supply.

### 4.5. Wiring

4) Connect the signal cable between the indoor and outdoor unit: Retrieve the signal cable from the accessories bag.

**Notice:** When fixing the power cable with the wire clip, take care to not clamp onto the wires within the sleeving. The clip must clamp onto the outer insulation sleeve, or else it may cause damage to one of the one-core wires.

- A. Insert one end of this cable through the cable gland on the bottom of the indoor unit, and connect it to A and B on the appropriate terminal block.
- B. Fasten the cable gland to ensure the cable won't get loosen.
- C. Connect the other end of the cable to the terminal block on the outdoor unit. A and B on the indoor unit should be connected with A, B, and G on the outdoor unit, otherwise communication failure error may occur.

### 4.5. Wiring

5) Connect the powercable between the indoor and outdoor unit:

Acquire a 3-core power cable of sufficient length that is compliant to all local safety regulations.

A. Insert one end of this cable through the cable gland on the bottom of the indoor unit, and connect it to A and B on the appropriate terminal block.

B. Fasten the cable gland to ensure the cable won't get loosen.

C. Connect the other end of the cable to the terminal block on the outdoor unit. A and B on the indoor unit should be connected with A, B, and G on the outdoor unit, otherwise communication failure error may occur.

### 4.5. Wiring

6) Connect the sensors and communication cables to the indoor unit.

- Retrieve all sensors and communication cables from the accessories bag.
- Connect all sensors to the communication cables, and insert the male end into the indoor unit through the cable glands.
- Connect them to the female quick connectors inside the indoor units.
- Place all sensors in the correct positions.
- After everything is connected, fasten the cable glands to prevent cables from loosening.

The wiring process is then complete.

### 4.6. Water Pipework

After installation of the unit is complete, connect the water inlet to outlet pipe according to local regulations, and confirm that there is flow. Have the piping pressure tested and cleaned before use.

#### 4.6.1. Filtration

A mesh filter should be installed between the water inlet of the unit and the water tank in order to keep collect any impurities and preserve water quality. The filter should be aimed down like below.

It is highly recommended to install check valves on both sides of the filter, to make cleaning or changing the filter later on easier.

#### 4.6.2. Insulation

All pipes running hot water should be well-insulated. No gaps should exist between insulation and outer pipe. Keep the check valves uncovered for future maintenance.

Before finishing, ensure that there is sufficient pressure to send water to the required heights. If not, a water pump can be added in order to increase pumping head.

#### 4.6.3. Water Quality Standards

- Water should contain less than 300 ppm of chloride (in temperatures less than  $60^{\circ}$ C)
- The pH value of the water should be between 6 to 8.
- No water containing ammonia should pass through this unit.

If the water quality is bad or the water flow is too weak, scale formation and clogging may eventually occur, which lowers efficiency of cooling and heating and can cause abormalities to occur.

Use pre-cleaned water, or purified water. Good water quality keeps the unit running in high efficiency.

### 4.7. Test run

After installation finished, please fulfill the water system with water and purge out air in the system before start-up.

#### 4.7.1. Before start-up

The list of verifications below must be performed before the unit starts up, to ensure best possible conditions for smooth long-term operation. The list is not exhaustive, and should only be used on a minimum reference basis:

- 1) Make sure the fans are rotating freely.
- 2) Confirm correct flow directions in water piping.
- 3) Verify all system piping matches installation instructions.
- 4) Check the voltage of the unit power supply and make certain it complies to authorized limitations.
- 5) The unit must be properly grounded.
- 6) Check for the presence of any damaged devices
- 7) Check all electrical connections and ensure they are secure.
- 8) Make sure there are no leaks in the piping and the space is well-ventilated.

Fix any problems above if they occur. If everything above is satisfied, the unit can start up.

#### 4.7.2. Starting Up

When the installation of the unit is completed, all water system pipes are confirmed to be well-connected, air purging is done, there are no leakages or other problems, the unit can be powered on.

Turn on the unit by pressing the on/off button on the operation panel. Listen carefully for any abnormal noise or vibrations, and ensure the display of the wired controller is normal.

After the unit has been on for 10 minutes and no abnormalties have occurred, the start-up process is complete. For problems and troubleshooting, please refer to the Service and Maintenance manual.

Final note: It is suggested to not run "heating" or "hot water" mode during ambient temperatures above  $32^{\circ}$ C, otherwise the unit may easily enter protection mode.
